Foreword

Manly Hydraulics Laboratory (MHL) is a business group within the NSW Department of Finance, Services and Innovation. The NSW water level database has been developed by MHL to support a number of programs associated with coastal, floodplain and estuary management for the NSW Office of Environment and Heritage. The monitoring service is available to local government and other organisations, both in Australia and overseas.

This annual summary presents water level measurements captured by automatic water level recording stations along the coastal estuaries and rivers of NSW from 1 July 2017 to 30 June 2018. MHL maintains the automatic recording stations and catalogues the data collected.

This summary provides information on how to access the data and additional data output types that are available on request.

Requests for further information should be directed to:

Executive summary

This report contains:

- a brief description of the estuary and river water level measurement program
- guidelines of how to use this report
- information on how to access the database
- a description of significant developments which occurred in 2017–2018
- a list of all stations for which MHL collected water level data in 2017–2018 (Table 4)
- maps of station locations and the annual data summaries for each site
- Appendix A which details the water level digitised continuous data and discrete historical data
- Appendix B which outlines some of the data analysis suites and presentation formats available
- Appendix C, a glossary of terms
- Appendix D, a list of other publications which may be of interest.

1. Water level monitoring program

This report presents the thirty-third year of water level data collected by MHL. The network of automatic recorders and the associated analysis routines enable efficient delivery of water level data. As well as near-real time water level information at over 220 stations in NSW, extracts from the historical database of water levels can be made available on request (refer to Appendix A).

The present program is based on a network of automatic water level recording stations installed at various coastal sites (see Section 5 Station Location Maps). This network consists of over 220 permanent stations funded by the NSW Office of Environment and Heritage (OEH), and over 100 short-term client-based project sites featuring site-specific systems of water level and water quality sensing. The network features four distinctive systems of data capture: gas purge pressure system, solid state Floatwell, submersible pressure transducer and ultrasonic/radar distance measuring units. The logging systems consist of data loggers which mostly record water levels every 15 minutes, while some stations record at a 1-minute logging interval. Each system functions as follows:

- Gas purge pressure system: the water level is determined by a pressurised constant flow of air through a line to a fixed point in the water column known as the orifice. The pressure in the line builds up to the same pressure as the water at that depth. This pressure is measured by the pressure sensor and converted into a water level by the data logger. The system relies on the principle that water depth is proportional to pressure. The system is shown in Figure 1.
- Solid state Floatwell: the water level is sensed by a float connected to a shaft encoder. The system is shown in Figure 2.
- Submersible water level transducer: the water level is determined by a vented pressure sensor and converted into a water level by the data logger. The system is shown in Figure 3.
- Ultrasonic/radar distance measuring units: pulses are transmitted from the transducer towards the water and are reflected by the water back to the transducer. The elapsed time from emission to reception of the signals is dependent on the distance and hence the water level can then be determined. The system is shown in Figure 4.

Data is transferred to the NSW Government Data Centre and to MHL's data server using a variety of telemetry techniques including internet protocol (IP), landline telephone, cellular networks and Event-reporting Radio Telemetry System (ERTS). The incoming raw data is then available to external users to view online in tables or plots, as schematised in Figure 5.

Data is stored in a database and subject to a quality assurance process which involves several control steps to maintain data quality as well as assignment of data quality codes Computer programs are used to further format and analyse data.

Data is backed up daily and archived to magnetic tape as a security measure at regular intervals, and copies are stored off site.

2. How to use this report

This report aims to streamline access to MHL's services and to the water level database.

The NSW coastal zone has been divided into geographic regions based on river systems. Location maps display the station locations and the annual plots confirm the availability and suitability of data for the particular period of interest. Maps and plots for the regions covered by this report are as follows:

- Tweed
- Coffs Harbour
- Hunter
- Metropolitan
- South Coast.

All the data appearing in this report are recorded in Australian Eastern Standard Time (EST). Allowance for daylight saving time has not been made.

A list of water level data collected and stored is included in Appendix A. Digitised continuous water level data is tabulated in Table A1, whilst discrete historical water level data (mainly from staff gauge readers) is tabulated in Table A2.

Once a choice has been made of the period for which information is required, data and services can be obtained in a variety of formats, according to their intended use.

Appendix B provides examples of data analysis and presentation formats available from MHL. Available water level related products include:

- graphical plots (see Figures B1, B3 and B4)
- time series data (see Figure B2)
- flood analyses (see Figures B5)
- tidal analyses (see Figures B6, B7)
- frequency analysis (see Figures B8, B9)
- catchment rainfall and level comparisons (see Figure B10)
- consulting services (see Figure B11)
- sample water quality plots (see Figure B12).

3. How to access the data

MHL provides a full online data access service via the internet for its clients, and a restricted service for the general public at http://www.mhl.nsw.gov.au

Typically, the last seven days of data are available to view online in a non-quality controlled form to aid the fastest possible access to data records. The online service for clients can provide access to all data catalogued in Appendix A.

Quality controlled data may be ordered via the MHL website (http://www.mhl.nsw.gov.au), by emailing data-request@mhl.nsw.gov.au, or via customised decision support tools that can be provided on request.

© Crown 2018

4. Significant events and developments

4.1 Significant events

During 2017–2018 most of the flood warnings issued by the Bureau of Meteorology (BoM) were due to heavy rain in the mid-north coast area in March 2018.

In October 2017, a minor flood warning was issued for Coffs Creek. In February 2018, a minor flood warning was issued for Marshalls Creek.

In March 2018, flood warnings were issued by the BoM for the mid-north coast area from Bellinger River to Paterson River. Minor flood warnings were issued for the Bellinger River, Macleay River, Camden Haven River, Manning River and Myall River; a minor to moderate warning issued for the Paterson River; a moderate flood warning issued for the Nambucca River; and a minor to major flood warning for the Hastings River.

During 2017–2018, flood warnings as described by the NSW State Emergency Service's (SES) NSW flood classification scale, were issued as listed below in Table 1.

Table 1 2017–2018 flood warnings

River/estuary system	Date	NSW SES classification
Marshalls Creek	February 2018	Minor
Coffs Creek	October 2017	Minor
Bellinger River	March 2018	Minor
Nambucca River	March 2018	Moderate
Macleay River	March 2018	Minor
Hastings River	March 2018	Minor to major
Camden Haven River	March 2018	Minor
Manning River	March 2018	Minor
Myall River	March 2018	Minor
Paterson River	March 2018	Minor to moderate

The NSW SES defines the level of flooding as follows:

Minor flooding: Causes inconvenience. Low-lying areas next to watercourses are inundated, which may require the removal of stock and equipment. Minor roads may be closed and low-level bridges submerged.

Moderate flooding: In addition to the above, the evacuation of some houses may be required. Main traffic routes may be covered. The area of inundation is substantial in rural areas, requiring the removal of stock.

Major flooding: In addition to the above, extensive rural areas and/or urban areas are inundated. Properties and towns are likely to be isolated and major traffic routes likely to be closed. Evacuation of people from flood-affected areas may be required.

© Crown 2018

4.2 Station upgrades

A number of water level gauging stations had significant infrastructure upgrade works undertaken. Some of these upgrades were the result of a network-wide audit to improve data reliability, safety of field operators and performance of stations during flood events. Details of these upgrades are shown in Table 2. Stations are listed based on locality from north to south. This aligns with Table 4 *Index of figures* in Section 5.

Table 2 2017–2018 station upgrades

Station name	Date	Issue		Comments
		Data quality/capture	WHS	
Mullumbimby	Feb-18	✓		Installed secondary submersible pressure transducer sensor as this station is a high priority flood warning station.
Saltwater Lagoon	Feb-18	✓		Installed new slide for sensor and new gauge plate.
Crescent Head	Mar-18	✓		Installed new pipework and slide for sensor.
Watson Taylors Lake	Mar-18	✓	✓	Installed slide for sensor and pit on bank for easy access to sensor.
Tuncurry Wetlands	Nov-17			Station decommissioned.
Nabiac	Jan-18	✓		Old secondary sensor removed, primary sensor connected to ERTS, rewired.
Tarbuck Bay	Apr-18	✓		Installed new primary gauge plate and post, replaced modem, installed new bracket to secure loose orifice.
Stockton Bridge	Nov-17	✓		Installed new bubble unit.
Raymond Terrace	Aug-18	✓	✓	Installed new bubble unit, regulator, transient barriers, orifice and GCO, new steel doors and locks on shed.
Barnsley Vale	Sep-17	✓		Installed new gauge post, new IP modems, new supports on orifice.
Hinton	Dec-17	✓		Installed new solar regulator.
Wallis Creek	Sep-17	✓	✓	Installed new bubble unit, new steel doors and locks on shed.
Narrabeen Bridge	Mar-18	✓		New IP modem.
Hewitts Creek Entrance	Apr-18	✓		Installed new 2–3 m gauge post and plate.
Bellambi Lagoon	Apr-18	✓		Installed new 2–3 m gauge post and plate.
Mullet Creek	Feb-18	✓		Installed new orifice, new 0–1 m gauge post and plate.
Koonawarra Bay	Feb-18	✓		Logging interval increased from 15 minutes to 1 minute.

© Crown 2018

Station name	Date	Issue		Comments
		Data quality/capture	WHS	
Cudgeree Bay	Nov-17	✓		Installed new sensor and logger program.
Princess Highway	Feb-18	✓	✓	Installed new radar station on the Princes Highway bridge as a secondary sensor. Used as reference check for the existing gas purge station and will be the primary site moving forward.
Little Lake Entrance	Jan-18	✓		Installed new 0–1 m gauge plate.
Lake Illawarra Entrance	Feb-18	✓		Logging interval increased from 15 minutes to 1 minute.
Shoalhaven Heads	Jun-18	✓		Installed new sensor PT2X, new gauge plate (-1 to 1).
Terara	Jun-18	✓		New gauge plate (-1 to 1).
Greenwell Point	Dec-17	✓		New gauge plate (-1 to 1).
Narrawallee Inlet	Mar-18	✓		Replaced gas purge sensor with pressure transducer.
Barlows Bay	Apr-18	✓	✓	Replaced Floatwell with pressure transducer.
Regatta Point	Jun-18	✓		New sensor and logger.
Lake Curalo	Jun-18	✓		New sensor.

4.3 Data provision

Water level data is provided to the public on behalf of OEH, through the following methods:

- the public webpages of MHL, OEH and BoM, providing near real-time access to a limited sample of data
- email correspondence and file transfer protocol (FTP)
- a web-based data request system where electronic requests can be submitted via MHL's homepage at http://www.mhl.nsw.gov.au under the *Data Request* menu
- a web-based self-serve portal has been developed to allow specific users to download data or access a web services application for automated data self-service. Contact MHL to obtain a user name and password: https://www.mhl.nsw.gov.au/services/mhladas/.

Water level data is provided to OEH and the SES through the following methods:

- OEH and SES officer access to a password-protected customised MHL web portal, providing near-real time environmental data and the 'quality assured' historical database
- SES officers receive automated notifications for flood warning systems.

Data access continues to assist the BoM, local government authorities, SES, NSW Police, WaterNSW, NSW Surf Life Saving Association, universities, the NSW court system, private consultancies and NSW Roads and Maritime Services.

© Crown 2018

Please note all water level data is available in Australian Height Datum (AHD) via the OEH password-protected customised MHL web portal and the MHL public web page, with the exception of local water resource datum and assumed datum stations.

During 2017–2018:

- MHL received in excess of 92,000 visits per month to its website
- MHL served in excess of 180,000 webpage hits per month to customers and to the public
- approximately 2.2 million individual webpage hits were recorded from the public (excluding customers) in 2017–2018.

© Crown 2018

5. Water level monitoring summary

5.1 Data capture performance

Water level data presented by MHL is collected, analysed and subjected to a strict quality assurance process in accordance with MHL's internal standards and work instructions. This process results in a quality code which is assigned to all water level data, as described in Table 3 below. Access to site and time specific station records, with quality codes is described in Section 3.

During 2017–2018, the overall data capture across the network, for data with a quality code of 162 or better, was 98.0%. Table 4 *Index of figures* provides data capture percentages for each river and estuary network. Missing or poor quality data can result in gaps in the data record. This can be caused by a range of reasons, such as sensor or equipment damage or failure, power failure, or site specific environmental issues such as siltation or collapse of waterway banks at gauging stations.

Automatic recorded water level data is typically recorded to a resolution that is higher than the actual level of certainty. A sensor may record data to three decimal places (measured in metres). However, due to systematic and random uncertainties involved in the collection of the data and the environment, data values may only be accurate to two decimal places. These uncertainties are accounted for through MHL's quality control and quality assurance processes.

Table 3 MHL data quality code descriptions

Quality code		Water level*
55	Records processed to	±20 mm
100	Data from previous MHL database, processed to	±20 mm
105	Records processed to	±50 mm
150	Uncoded – data not yet quality controlled	Raw data from the instrument with only preliminary quality checks performed
161, 162	Dry sensor	Sensor out of water with flow/with no flow
208	Records processed to greater than	>±50 mm
204, 205, 206, 207, 255	Data loss/data missing	

* A quality code is assigned based on infield status verification checks.

5.2 Interpretation of data

There are various factors which can influence water level data in the extensive network of OEH automated water level recorders, operated and maintained by MHL. Differences between sites can be attributed to the characteristics of the overall water body being analysed, and also characteristics specific to the station locality and design.

Report MHL2100 *Water Level Frequency Distribution Analysis* (March 2014) provides a statistical analysis and frequency distribution analysis of available water level information for the majority of water level stations. Stations are classified into one of three station types:

© Crown 2018

1. ocean tide stations ('O', dominated by a semi-diurnal tide)
2. estuary stations ('E', particularly intermittently closed and open lakes and lagoons (ICOLLs), generally having a reduced tidal influence, and may experience both flood conditions and static water levels, governed by entrance morphology)
3. flood stations ('F', upstream of tidal influence or behind weirs, and dominated by dramatic water level fluctuations during low frequency flood events).

Review by the reader of MHL2100 concurrently with this publication, and familiarity with environmental factors in interpretation of the presented data, is recommended to assist interpretation for the station of interest.

Refer to Report MHL2618 *Ocean and River Entrance Tidal Levels Annual Summary 2017–2018*, for annual water level data at ocean tide classified sites.

5.3 Water level monitoring summary

This section documents locality maps and quality assured water level monitoring summaries for each station. Table 4 and Table 6 provide indexes to the figures presented.

^ Data capture percentages do not include ocean tide stations

AHD	Australian Height Datum
CTF	Cease to Flow of control structure
AD	Assumed Datum
LWRD	Local Water Resources Datum

Water level readings for all the estuaries are available in AHD with the exception of Logans Crossing and Mount George, which are in the local water resources datum (LWRD); Kooroowi and Ashlea Bridge Downstream, which are in an assumed datum (AD) and Woolgoolga which is using Cease to Flow of control structure (CTF) as gauge zero. There are a number of estuary level gauges that still maintain level data in the local port datum, which generally equates to Indian Springs Low Water (ISLW). An indicative adjustment from the AHD level to local datum is shown in Table 5. AHD levels were calculated circa 1990 for MHL by NSW Public Works Survey, using range ratio method and tidal harmonic analysis over varying time periods. Please note that AHD levels are revised from time to time and improvements to GPS surveying techniques may provide additional refinement.

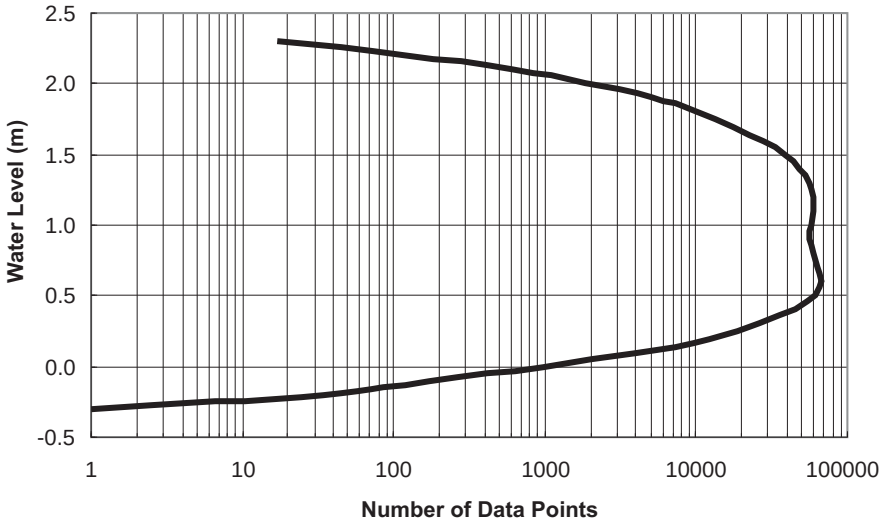
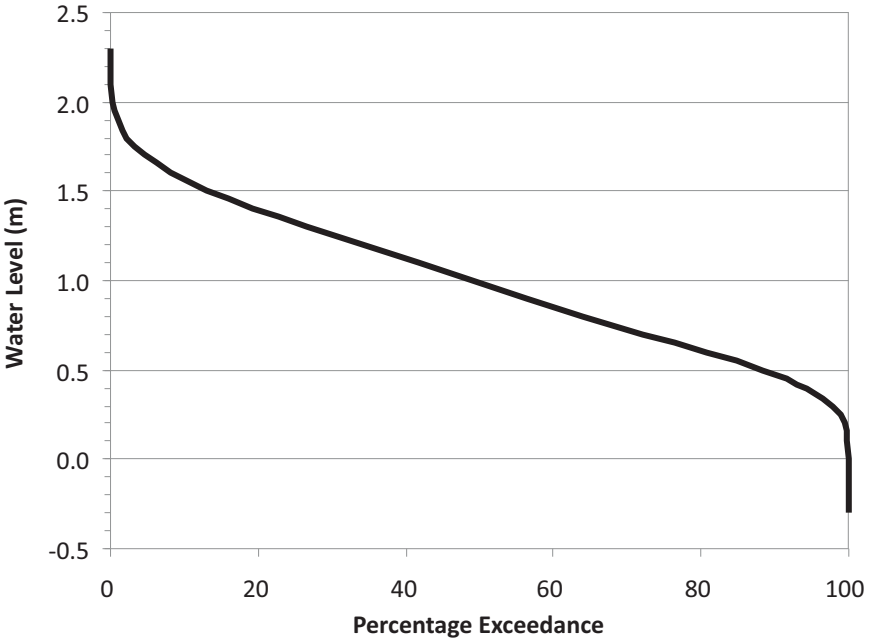
Station Information	
River/Estuary System	Port Jackson
AWRC No.	213470
Station name	Sydney
Datum	Zero Camp Cove*
MGA Zone	56
Easting	338842
Northing	6255836



Summary Statistics	
Time Interval (mins)	15
Record start date	24/09/1987
Highest water level recorded (m)	2.32
Date recorded	27/04/1990
Lowest water level recorded (m)	-0.28
Date recorded	28/02/2010
Tidal plane annual average record	1990-2010
MHW (m)	1.45
MSL (m)	0.95
MLW (m)	0.44



Notes:

Refer to Appendix B for frequency distribution analysis table.

*The information supplied has been collected for use by the Office of Environment & Heritage, and the water levels only approximately relate to Australian Height Datum (AHD) or other specified datum. Other users should independently verify the suitability of this data for their particular use.

Appendix C Glossary of terms

The following glossary of terms defines common terms used across MHL publications referenced in Appendix D.

Amplitude (H)	One-half of the difference in height between consecutive high water and low water, hence half the tide range.
Automatic Tide Gauge	An instrument that automatically registers the rise and fall of the tide. In some instruments, the registration is accomplished by recording the heights at regular time intervals in digital format.
Benchmark (BM)	A fixed physical object or mark used as reference for a vertical datum. A tidal benchmark is one near a tide station to which the tide staff and tidal datums are referred. A primary benchmark is the principal (or only) mark of a group of tidal benchmarks to which the tide staff and tidal datums are referred.
Chart Datum	The datum to which soundings on a chart are referred. It is usually taken to correspond to a low-water elevation, and its depression below mean sea level is represented by the symbol Z.
Coastal Boundary	The Mean High Water Line (MHWL) or Mean Higher High Water Line (MHHWL) when tidal lines are used as the coastal boundary. Also, lines used as boundaries inland of and measured from (or points thereon) the MHWL or MHHWL.
Constituent	One of the harmonic elements in a mathematical expression for the tide-producing force and in corresponding formulas for the tide or tidal current. Each constituent represents a periodic change or variation in the relative positions of the earth, moon and sun. A single constituent is usually written in the form y = A cos (at + á), in which y is a function of time as expressed by the symbol t and is reckoned from a specific origin. The coefficient A is called the amplitude of the constituent and is a measure of its relative importance. The angle (at + á) changes uniformly and its value at any time is called the phase of the constituent. The speed of the constituent is the rate of change in its phase and is represented by the symbol a in the formula. The quantity a is the phase of the constituent at the initial instant from which the time is reckoned. The period of the constituent is the time required for the phase to change through 360° and is the cycle of the astronomical condition represented by the constituent.
Digital Recorder (or logger)	An electronic recorder system which stores the information in accessible form, for example, on tape or solid state memory.
Digitise	To translate analog information into digital form i.e. a series of numeric data readable by, and stored within, a digital computer.

© Crown 2018

Diurnal	Having a period or cycle of approximately one tidal day. Thus, the tide is said to be diurnal when only one high water and one low water occur during a tidal day, and the tidal current is said to be diurnal when there is a single flood and a single ebb period of a reversing current in the tidal day. A rotary current is diurnal if it changes its direction through all points of the compass once each tidal day. A diurnal constituent is one which has a single period in the constituent day. The symbol for such a constituent is the subscript 1.
Encoder	A device that translates tidal movement into computer readable data.
Estuary	An embayment of the coast in which fresh river water entering at its head mixes with the relatively saline ocean water. When tidal action is the dominant mixing agent it is usually termed a tidal estuary. Also, the lower reaches and mouth of a river emptying directly into the sea where tidal mixing takes place. The latter is sometimes called a river estuary.
Extreme High Water	The highest elevation reached by the sea as recorded by a tide gauge during a given period.
Extreme Low Water	The lowest elevation reached by the sea as recorded by a tide gauge during a given period.
Floatwell	A stilling well in which the float of a float-actuated gauge operates.
Gas Purged Pressure Gauge	A type of analog tide gauge in which gas, usually nitrogen, is emitted from a submerged tube at a constant rate. Fluctuations in hydrostatic pressure due to changes in tidal height modify the emission rate for recording.
Harmonic Analysis	Process of measuring or calculating the relative amplitudes and frequencies of all the significant harmonic components present in a given wave form.
Harmonic Prediction	Method of predicting tides by combining the harmonic constituents into a single tidal curve. The work is usually performed by electronic digital computer.
Head	The difference in water level at either end of a strait, channel, inlet, etc.
High Water (HW)	The maximum height reached by a rising tide. The high water is due to the periodic tidal forces and the effects of meteorological, hydrologic, and/or oceanographic conditions. For tidal datum computational purposes, the maximum height is not considered a high water unless it contains a tidal high water.
High Water Mark	A line or mark left upon tide flats, beach, or alongshore objects indicating the elevation of the intrusion of high water. The mark may be a line of oil or scum on alongshore objects, or a more or less continuous deposit of fine shell or debris on the foreshore or berm. This mark is physical evidence of the general height reached by wave runup at recent high waters. It should not be confused with the Mean High Water Line or Mean Higher High Water Line.
Higher High Water (HHW)	The highest of the high waters (or single high water) of any specified tidal day due to the declination A_l effects of the moon and sun.
Higher Low Water (HLW)	The highest of the low waters of any specified tidal day due to the declination A_l effects of the moon and sun.

© Crown 2018

Highest Astronomical Tide (HAT)	The highest level which can be predicted to occur under average meteorological conditions and under any combination of astronomical conditions; this level will not be reached every year. HAT is not the extreme level which can be reached as storm surges may cause considerably higher levels to occur.
Hydrographic Datum	A datum used for referencing depths of water and the heights of predicted tides or water level observations. Same as Chart Datum. See Datum.
Indian Spring Low Water	A datum originated by Professor G. H. Darwin when investigating the tides of India. It is an elevation depressed below mean sea level by an amount equal to the sum of the amplitudes of the harmonic constituents M_2, S_2, K_1, and O_1.
Inverse Barometer Effect	The inverse response of sea level to changes in atmospheric pressure. A static reduction of 1.005 mb in atmospheric pressure will cause a stationary rise of 1 cm in sea level.
K_1	Lunisolar diurnal constituent. This constituent, with O_1, expresses the effect of the moon's declination. They account for diurnal inequality and, at extremes, diurnal tides. With P_1, it expresses the effect of the sun's declination. Speed = T + h = 15.041,068,6° per solar hour.
Lambda	Smaller lunar evectional constituent. This constituent, with V_2, U_2, and (S_2), modulates the amplitude and frequency of M_2 for the effects of variation in solar attraction of the moon. This attraction results in a slight pear-shaped lunar ellipse and a difference in lunar orbital speed between motion toward and away from the sun. Although (S_2) has the same speed as S_2, its amplitude is extremely small. Speed = 2T - s + p = 29.455,625,3° per solar hour.
Low Water (LW)	The minimum height reached by a falling tide. The low water is due to the periodic tidal forces and the effects of meteorological, hydrologic, and/or oceanographic conditions. For tidal datum computational purposes, the minimum height is not considered a low water unless it contains a tidal low water.
Lower High Water (LHW)	The lowest of the high waters of any specified tidal day due to the declination A_l effects of the moon and sun.
Lower Low Water (LLW)	The lowest of the low waters (or single low water) of any specified tidal day due to the declination A_l effects of the moon and sun.
Lowest Astronomical Tide (LAT)	The lowest level which can be predicted to occur under average meteorological conditions and under any combination of astronomical conditions; this level will not be reached every year. LAT is not the extreme level which can be reached as storm surges may cause considerably lower levels to occur.
Lunar tide	That part of the tide on the earth due solely to the moon as distinguished from that part due to the sun.
Magnetic Tape	Recording tape on which (numeric) data may be stored.
M_2	Principal lunar semi-diurnal constituent. This constituent represents the rotation of the Earth with respect to the Moon. Speed = 2T - 2s + 2h = 28.984,104,2° per solar hour.
Mean High Water (MHW)	A tidal datum. The average of Mean High Water Spring and Mean High Water Neap.

© Crown 2018

Mean High Water Springs (MHWS), Mean Low Water Springs (MLWS)	The height of MHWS is the average, throughout a year when the average maximum declination of the moon is 23.5°, of the heights of two successive high waters during those periods of 24 hours (approximately once a fortnight) when the range of the tide is the greatest. The height of MLWS is the average height obtained by the two successive low waters during the same periods.
Mean High Water Neaps (MHWN), Mean Low Water Neaps (MLWN)	The height of MHWN is the average, throughout a year, as defined above, of two successive high waters during those periods of 24 hours (approximately once a fortnight) when the range of the tide is least. The height of MLWN is the average height obtained by the two successive low waters during the same periods.
Mean Range of Tide (Mn)	The difference in height between Mean High Water and Mean Low Water.
Modem	A device allowing a computer to be accessed over a telephone line.
Neap Tides	Tides of decreased range or tidal currents of decreased speed occurring semi-monthly as the result of the moon being in quadrature. The neap range (Np) of the tide is the average range occurring at the time of neap tides and is most conveniently computed from the harmonic constants. It is smaller than the mean range where the type of tide is either semi-diurnal or mixed and is of no practical significance where the type of tide is predominantly diurnal. The average height of the high waters of the neap tide is called Neap High Water or High Water Neaps (MHWN) and the average height of the corresponding low waters is called Neap Low Water or Low Water Neaps (MLWN).
O_1	Lunar diurnal constituent. See K_1. Speed = T - 2s + h = 13.943,035,6° per solar hour.
Phase	1. Any recurring aspect of a periodic phenomenon, such as new moon, high water, flood strength, etc. 2. A particular instant of a periodic function expressed in angular measure and reckoned from the time of its maximum value, the entire period of the function being taken as 360°. The maximum and minimum of a harmonic constituent have phase values of 0° and 180°, respectively.
Pressure Sensor	A pressure transducer sensing device for water level measurement. A relative transducer is vented to the atmosphere and pressure readings are made relative to atmospheric pressure. An absolute transducer measures the pressure at its location. The readings are then corrected for barometric pressure taken at the surface.
Range of Tide	The difference in height between consecutive high and low waters. The mean range is the difference in height between mean high water and mean low water. The great diurnal range or diurnal range is the difference in height between mean higher high water and mean lower low water.
Relative Mean Sea Level Change	A local change in mean sea level relative to a network of benchmarks established in the most stable and permanent material available (bedrock, if possible) on the land adjacent to the tide station location. A change in relative mean sea level may be composed of both an absolute mean sea level change component and a vertical land movement change component, together.

S_2	Principal solar semi-diurnal constituent. This constituent represents the rotation of the Earth with respect to the Sun. Speed = 2T = 30.000,000,0° per solar hour.
Seiche	A stationary wave usually caused by strong winds and/or changes in barometric pressure. It is found in lakes, semi-enclosed bodies of water, and in areas of the open ocean. The period of a seiche in an enclosed rectangular body of water is usually represented by the formula: Period (T) = 2L / square root (gd) in which L is the length, d the average depth of the body of water, and g the acceleration of gravity.
Semi-Diurnal	Having a period or cycle of approximately one-half of a tidal day. The predominant type of tide throughout the world is semi-diurnal, with two high waters and two low waters each tidal day. The tidal current is said to be semi-diurnal when there are two flood and two ebb periods each day. A semi-diurnal constituent has two maxima and two minima each constituent day, and its symbol is the subscript 2.
Shallow Water Constituent	A short-period harmonic term introduced into the formula of tidal (or tidal current) constituents to take account of the change in the form of a tide wave resulting from shallow water conditions. Shallow water constituents include the overtides and compound tides.
Slack Water (Slack)	The state of a tidal current when its speed is near zero, especially the moment when a reversing current changes direction and its speed is zero. The term also is applied to the entire period of low speed near the time of turning of the current when it is too weak to be of any practical importance in navigation. The relation of the time of slack water to the tidal phases varies in different localities. For a perfect standing tidal wave, slack water occurs at the time of high and of low water, while for a perfect progressive tidal wave, slack occurs midway between high and low water.
Solar Tide	1. The part of the tide that is due to the tide-producing force of the sun. 2. The observed tide in areas where the solar tide is dominant. This condition provides for phase repetition at about the same time each solar day.
Solid State	An electronic device composed of components with no moving parts – in this instance, using the electronic properties of solids, as in transistors, semi-conductors and integrated circuits.
Spring High Water	Same as Mean High Water Springs (MHWS). See Spring Tides.
Spring Low Water	Same as Mean Low Water Springs (MLWS). See Spring Tides and Mean Low Water Springs.
Spring Tides	Tides of increased range or tidal currents of increased speed occurring semi-monthly as the result of the moon being new or full. The spring range (Sg) of tide is the average range occurring at the time of spring tides and is most conveniently computed from the harmonic constants. It is larger than the mean range where the type of tide is either semi- diurnal or mixed, and is of no practical significance where the type of tide is predominantly diurnal. The average height of the high waters of the spring tides is called Spring High Water or Mean High Water Springs (MHWS) and the average height of the corresponding low waters is called Spring Low Water or Mean Low Water Springs (MLWS).

Storm Surge	The local change in the elevation of the ocean along a shore due to a storm. The storm surge is measured by subtracting the astronomic tidal elevation from the total elevation. It typically has a duration of a few hours. Since wind generated waves ride on top of the storm surge (and are not included in the definition), the total instantaneous elevation may greatly exceed the predicted storm surge plus astronomic tide. It is potentially catastrophic, especially on low-lying coasts with gently sloping offshore topography.
Telemeter	Transmit data to a distant receiving station via a telephone line or by telegraphic means.
Tidal Characteristics	Principally, those features relating to the time, range, and type of tide.
Tidal Constants	Tidal relations that remain practically constant for any particular locality. Tidal constants are classified as harmonic and non-harmonic. The harmonic constants consist of the amplitudes and epochs of the harmonic constituents, and the non-harmonic constants include the ranges and intervals derived directly from the high and low water observations.
Tidal Current	A horizontal movement of the water caused by gravitational interactions between the Sun, Moon and Earth. The horizontal component of the particulate motion of a tidal wave. Part of the same general movement of the sea that is manifested in the vertical rise and fall called tide.
Tide	The periodic rise and fall of the water resulting from gravitational interactions between Sun, Moon and Earth. The vertical component of the particulate motion of a tidal wave. Although the accompanying horizontal movement of the water is part of the same phenomenon, it is preferable to designate this motion as tidal current.
Tide Curve	A graphic representation of the rise and fall of the tide in which time is usually represented by the abscissa and height by the ordinate. For a semi-diurnal tide with little diurnal inequality, the graphic representation approximates a cosine curve.
Tide (Water Level) Gauge	An instrument for measuring the rise and fall of the tide (Water Level).
Tide Tables	Tables which give daily predictions of the times and heights of high and low waters. These predictions are usually supplemented by tidal differences and constants through which predictions can be obtained for numerous other locations.
Tsunami	A shallow water progressive wave, potentially catastrophic, caused by an underwater earthquake or volcano.
Universal Time (UTC)	Same as Greenwich Mean Time (GMT).
Z_0	Symbol recommended by the International Hydrographic Organisation to represent the elevation of mean sea level above chart datum.
